LeetGotchi: The Pet That Dies If You Cheat. Lynx Hack 2026 . Educational & Learning

The Problem

- 70% of CS students use AI to solve LeetCode problems
- No accountability in self-study
- Interview prep without real understanding = failure
- "You can't cheat your way to competence"

The Solution

- A Tamagotchi pet that lives or dies based on honest practice
- 30 minute minimum timer
- Must explain problem, approach, complexity, and reflect
- AI agent evaluates if you actually understood it
- Pet evolves with your streak, dies if you skip

How It Works

- User explains problem → writes solution → runs test cases
- Gemini AI reads all explanations and scores honesty 0-100
- Score below 60 → pet loses health
- Score above 60 → pet gains health and Xp
- Miss a day → pet gets sick

Tech Stack

- Flask + SQLite (backend)
- HTML/CSS/JS (frontend)
- Google Gemini API (AI agent)
- Python subprocess (live code runner)
- GitHub:github.com/ahmedbacaad/leetgotchi

Impact

- Turns passive scrolling into active accountability
- Makes cheating emotionally costly
- Builds real interview skills through forced explanation
- "The only LeetCode tool that actually knows if you tried"
